

Jet Shapes of Isolated Photon-Tagged Jets in Pb-Pb and pp Collisions at $\sqrt{s_{NN}} = 5.02$ TeVA. M. Sirunyan *et al.**
(CMS Collaboration) (Received 23 September 2018; published 17 April 2019)

The modification of jet shapes in Pb-Pb collisions, relative to those in pp collisions, is studied for jets associated with an isolated photon. The data were collected with the CMS detector at the LHC at a nucleon-nucleon center-of-mass energy of 5.02 TeV. Jet shapes are constructed from charged particles with track transverse momenta (p_T) above 1 GeV/ c in annuli around the axes of jets with $p_T^{\text{jet}} > 30$ GeV/ c associated with an isolated photon with $p_T^\gamma > 60$ GeV/ c . The jet shape distributions are consistent between peripheral Pb-Pb and pp collisions, but are modified for more central Pb-Pb collisions. In these central Pb-Pb events, a larger fraction of the jet momentum is observed at larger distances from the jet axis compared to pp , reflecting the interaction between the partonic medium created in heavy ion collisions and the traversing partons.

DOI: [10.1103/PhysRevLett.122.152001](https://doi.org/10.1103/PhysRevLett.122.152001)

The quark-gluon plasma (QGP) [1], a deconfined state of quarks and gluons, can be created in relativistic heavy ion collisions. It can be probed with energetic partons emerging from initial hard scattering processes in the same collisions. The outgoing partons eventually fragment, and each forms a jet of collimated particles that can be observed experimentally. The interactions of the partons with the medium, and therefore the modification of the resulting jets, can be related to the thermodynamical and transport properties of the traversed medium [2–7]. To better understand the dynamics of the QGP, it is important to explore the mechanisms by which the partons lose energy to the medium, whether by radiation, scattering off its pointlike constituents, or by some other processes [8–12].

The CERN LHC Collaborations have studied the medium-induced modifications of jets by measuring the jet yield for a given transverse momentum (p_T) [13–17] and jet substructure [18–29]. In these types of jet measurements, there is limited information on the initial energy of the parton, i.e., before its interaction with the medium. On the other hand, by studying jets produced in association with an electroweak boson, such as a photon or a Z boson, whose p_T can be precisely measured, the initial parent parton p_T can be tightly constrained, as electroweak bosons do not interact strongly with the medium [30–32]. At LHC energies, these types of processes have an additional advantage: jets associated with an electroweak boson are

dominated by quark jets for $p_T^{\text{jet}} > 30$ GeV/ c [33], hence providing information specifically on quark energy loss, and therefore constraining the dependence of energy loss on parton (quark or gluon) flavor [34,35].

The CMS Collaboration has previously measured the azimuthal correlation and momentum imbalance of isolated photon + jet pairs in proton-proton (pp) and lead-lead (Pb-Pb) collisions at nucleon-nucleon center-of-mass energies of $\sqrt{s_{NN}} = 2.76$ and 5.02 TeV [36,37], and of Z + jet pairs at 5.02 TeV [38]. More recently, the fragmentation functions of jets tagged with a measured the azimuthal correlation measured the azimuthal correlation [39]. A photon is considered isolated if the total transverse energy of other particles in a cone of fixed radius around its direction is small after taking into account the underlying event (UE) contributions as explained in Refs. [37,40]. This definition suppresses dijet events in which a high- p_T photon originates from one of the jets, either via collinear fragmentation of a parton (“fragmentation photons”) or via decays of neutral mesons (“decay photons”). The results showed that in central Pb-Pb collisions there is an excess of low- p_T particles and a depletion of high- p_T particles inside the jet cone. The jet fragmentation functions reflect the momentum distribution inside the parton shower in the longitudinal direction, making it highly sensitive to the hadronization process [34]. A complementary observable for medium-induced modifications that features reduced sensitivity to hadronization is the jet radial momentum density profile, i.e., the jet shape, which is a measure of the component of the momentum transverse to the jet axis [41,42]. Jet shape measurements so far were done using inclusive jet [19,28] or dijet samples [23].

This Letter reports the first measurement of the differential jet shape for jets associated with an isolated photon. The differential jet shape $\rho(r)$ is defined as

$$\rho(r) = \frac{1}{\delta r} \frac{\sum_{\text{jets}} \sum_{r_a < r < r_b} (p_T^{\text{trk}}/p_T^{\text{jet}})}{\sum_{\text{jets}} \sum_{0 < r < r_f} (p_T^{\text{trk}}/p_T^{\text{jet}})}, \quad (1)$$

where $\delta r = r_b - r_a$ is the width of the annulus of inner and outer radii r_a and r_b with respect to the jet axis, respectively, p_T^{trk} is the p_T of tracks falling within each annulus of the jet with p_T^{jet} , and $r = \sqrt{(\eta^{\text{jet}} - \eta^{\text{trk}})^2 + (\phi^{\text{jet}} - \phi^{\text{trk}})^2}$ is the distance between the track and the jet axis in pseudorapidity (η) and azimuthal angle (ϕ) plane. The distribution is normalized such that the integral inside the range $0 < r < r_f$ is unity where $r_f = 0.3$. Hence, $\rho(r)$ gives a measure of how the p_T of a jet is distributed (over charged particles) in a direction transverse to the jet axis. The analysis uses Pb-Pb and pp data at $\sqrt{s_{NN}} = 5.02$ TeV collected in 2015, corresponding to integrated luminosities of $404 \mu\text{b}^{-1}$ and 27.4pb^{-1} , respectively.

The central feature of the CMS detector is a superconducting solenoid of 6 m internal diameter, providing a magnetic field of 3.8 T. Within the solenoid volume are a silicon pixel and strip tracker, a lead tungstate crystal electromagnetic calorimeter (ECAL), and a brass and scintillator hadron calorimeter (HCAL), each composed of a barrel and two end cap sections. Hadron forward (HF) calorimeters extend the coverage up to $|\eta| = 5.2$ and are used for event selection. In addition, in the case of Pb-Pb events, the HF signals are used to determine the degree of overlap (“centrality”) of the two colliding Pb nuclei [43] and the event-by-event ϕ angle of maximum particle density (“event plane”) [44]. A more detailed description of the CMS detector can be found in Ref. [45].

The event samples are selected online with a trigger requiring a photon with $p_T^\gamma > 40 \text{ GeV}/c$ [37,39]. Additional requirements are applied off-line to remove noncollision events such as beam-gas interactions [46]. For jets and photons, the reconstruction algorithms, analysis selections, and corrections for the energy scale and resolution are the same as in Refs. [37,39]. For Pb-Pb collisions, the event centrality is defined as the fraction of the total inelastic hadronic cross section of these collisions at $\sqrt{s_{NN}} = 5.02$ TeV, starting at 0% for the most central collisions, and is evaluated as percentiles of the distribution of the energy deposited in the HF calorimeters [43]. Results are presented in four centrality intervals: 0%–10%, 10%–30%, 30%–50%, and 50%–100%.

The photon candidates are restricted to the barrel of the ECAL, $|\eta^\gamma| < 1.44$, and are required to have $p_T^\gamma > 60 \text{ GeV}/c$. The trigger is fully efficient for these requirements. Electron contamination and anomalous signals caused by the interaction of highly ionizing particles with the photodiodes used for the ECAL readout are removed, as described in Ref. [47]. Background from hadronic showers is rejected by requiring that the ratio of the HCAL over ECAL energy inside a cone of radius $\delta R = \sqrt{(\Delta\eta)^2 + (\Delta\phi)^2} = 0.15$ around the photon candidate is smaller than 0.1 [40,47].

Background contributions from fragmentation and decay photons are rejected by imposing the same isolation requirements as in Refs. [37,47]: the p_T sum in a cone of radius 0.4 with respect to the centroid of the cluster, not including the p_T of the cluster and after correcting for the UE (only in Pb-Pb collisions), is required to be less than $1 \text{ GeV}/c$. The dominant remaining background is from ECAL showers initiated by isolated neutral mesons, e.g., π^0 , η , and ω , decaying into pairs of photons that, because of their small opening angle, are reconstructed as a single photon. Their contribution can be reduced by a factor of ~ 2 using an upper limit on the shower shape variable $\sigma_{\eta\eta}$, which is a measure of the width of the ECAL energy cluster distribution in η direction [37,47].

The energy of the reconstructed photons is corrected to account for the losses due to material in front of the ECAL and for incomplete shower containment [48]. An additional correction is applied in Pb-Pb collisions to account for the contribution of the UE formed by soft processes. The corrections are obtained from photon events simulated using the CUETP8M1 tune [49] of the PYTHIA 8.212 [50] Monte Carlo (MC) event generator. The effect of the Pb-Pb UE is modeled by embedding the PYTHIA output in events generated using HYDJET 1.9 [51], which is tuned to reproduce global event properties, such as the UE p_T density, charged-hadron multiplicity and p_T distribution. The size of the resulting energy correction for isolated photons varies from 0% to 10%, depending on the p_T^γ and the centrality. The CMS detector response for generated events is simulated using GEANT4 [52].

Jets are reconstructed from the output of the CMS particle-flow algorithm [53], which aims to reconstruct and identify each individual particle in an event, with an optimized combination of information from the various elements of the detector. The anti- k_T algorithm [54,55] is used to cluster the resulting particles using a distance parameter $R = 0.3$ chosen to minimize the effects of UE fluctuations. In order to subtract the UE background in Pb-Pb collisions, an iterative algorithm [56] is employed [36,43,57]. In pp collisions, where the UE level is negligible, jets are reconstructed without UE subtraction. Additional Pb-Pb (pp) collisions in the same or adjacent bunch crossings are negligible (small) and their effects are found, using MC studies, to be negligible. The jet energy corrections are derived from simulation, separately for pp and Pb-Pb collisions. They are validated via energy balance methods applied to dijet and photon + jet events in pp data [58], reconstructed alternatively with the pp and Pb-Pb reconstruction algorithms. Jets with $|\eta^{\text{jet}}| < 1.6$ and corrected $p_T^{\text{jet}} > 30 \text{ GeV}/c$ are selected.

In each event, photon + jet pairs are formed by associating the highest p_T^γ isolated photon candidate with all jets that pass the jet selection criteria. An azimuthal separation of $\Delta\phi_{j\gamma} = |\phi^{\text{jet}} - \phi^\gamma| > 7\pi/8$ is applied to the photon + jet pairs to suppress contributions from background jets

(jets not originating from the same hard scattering as the photon) and from photon + multijet events (the hard scattering produces more than one parton balancing the photon). The tracks used in this measurement have $p_T^{\text{trk}} > 1 \text{ GeV}/c$, $|\eta^{\text{trk}}| < 2.4$, and must fall within a cone of radius $\delta R = 0.3$ around the jet direction. These selection criteria, as well as the corrections for tracking efficiency, detector acceptance, and misreconstruction rate, are the same as in Ref. [46] for both pp and Pb-Pb data.

To isolate the contribution of photons, jets, and charged particles that are produced in the same hard scattering in Pb-Pb collisions, several sources of combinatorial backgrounds are subtracted: tracks from the UE that fall within the cone around the selected jet, misidentified jets resulting from UE fluctuations, and jets not produced in the same hard parton-parton scatterings as the photon. The shape and magnitude of these contributions to the $\rho(r)$ distributions are estimated from data with an event mixing procedure, in which either the isolated photon or the jet are combined with jets and tracks found in events chosen randomly from a minimum bias (MB) Pb-Pb dataset with similar event characteristics (centrality, interaction vertex position, and event plane angle, which is correlated to particle density in the ϕ direction). The background contribution from UE tracks is estimated by constructing the distribution for each selected jet using tracks from MB events. The backgrounds from jets produced by UE fluctuations or a different hard parton-parton scattering are estimated as in Refs. [36,37]. The normalizations of these combinatorial background distributions are given by the number of MB events used. Simulation shows that the UE particle density can be different between a hard scattering event (PYTHIA+HYDJET) and a MB event (HYDJET only) that have the same reconstructed centrality. Therefore, the normalized background distributions are further scaled with a residual factor to account for this effect before being subtracted from those in photon + jet events.

An additional correction is applied for effects such as detector resolution, particle reconstruction, and UE particles uncorrelated to the true jet. This correction is calculated from the PYTHIA+HYDJET (PYTHIA) sample for the Pb-Pb (pp) results. The distributions from reconstructed (detector-level) jets are corrected to the ones from true (generator-level) jets as a function of r . The correction is calculated in three steps. (i) The jet shapes for reconstructed jets using reconstructed tracks are corrected to the ones that use true charged particles. This step accounts for the reconstructed track yield that decreases with the distance between the track and jet axis, an effect resulting from the correlation between track reconstruction efficiency and jet reconstruction. The average corrections for $r < 0.2$ ($r > 0.2$) are ~ 4 (5)% for pp and ~ 4 (10)% for 0%–10% centrality Pb-Pb results. (ii) The jet shapes obtained after the first step are corrected to the ones that use true charged particles from the signal PYTHIA event.

This step accounts for the correlations between the reconstructed jet and tracks from the UE and is applied for Pb-Pb data only. The average corrections for $r < 0.2$ ($r > 0.2$) are ~ 10 (15)% for 0%–10% centrality Pb-Pb results. (iii) The jet shapes obtained after the second step are corrected to the ones for true jets. This last step accounts for the difference between the jet shapes for reconstructed and true jets. The average corrections for $r < 0.2$ ($r > 0.2$) are ~ 2 (3)% for pp and ~ 20 (35)% for 0%–10% centrality Pb-Pb results. The corrections are calculated in bins of r , p_T^{jet} , η^{jet} , p_T^{trk} , and centrality. The largest corrections happen at $r \approx 0.3$ and their average values in the first, second, and third steps for 0%–10% centrality Pb-Pb (pp) collisions are 15 (6)%, 20 (0)%, and 45 (4)%, respectively. Studies have been done separately for the shapes of quark and gluon jets in order to check if the corrections, which do not take parton flavor into account, cause a bias in the results. The corrections improve the agreement between reconstructed and true jets for both quark and gluon jets in both PYTHIA and PYTHIA+HYDJET samples.

A final correction accounts for the photon purity, defined to be the fraction of photons within the set of isolated photon candidates that do not originate from hadron decays and that pass the σ_{jet} requirement. This fraction is extracted from the data using a template fit to the σ_{jet} distribution [36,37]. The shape of the $\rho(r)$ distributions from decay photons is estimated by repeating the analysis selecting photons with larger σ_{jet} (wider shower shapes). The purity values (e.g., 0.68 and 0.82 for 0%–10% and 50%–100% Pb-Pb collisions, respectively) from the shower shape fits are used to adjust the magnitude of this background contribution.

Several sources of systematic uncertainty are considered, including the photon purity, photon isolation, photon energy scale, electron contamination, photon selection efficiency, jet energy scale, jet energy resolution, tracking efficiency, r -dependent corrections, and background subtraction. The total uncertainty in each bin is the sum in quadrature of the individual uncertainties. The quoted systematic uncertainties are an average over all r bins. In the case of the Pb-Pb results, uncertainties are reported only for the 0%–10% centrality interval, which has generally the highest uncertainties among all the centrality bins.

To evaluate the systematic uncertainties related to the isolated photons, the same procedures are applied as in Ref. [37]. The uncertainty in the photon purity is evaluated by varying the components of the shower shape template, as in Ref. [36]. The maximum variations with respect to the nominal case are propagated as systematic uncertainties, amounting to 0.6 (0.3)% for the Pb-Pb (pp) results. In the following, the uncertainties will continue to be quoted for central Pb-Pb events first, then for pp data. The systematic uncertainties resulting from the experimental isolation criteria for a photon are 1.9% and 0.1%. The residual data-to-simulation photon energy scale difference after applying the photon energy corrections is also quoted as

a systematic uncertainty of 0.7% for Pb-Pb data, while it is negligible for pp data. The level of electron contamination in the samples before applying the electron rejection criteria is 14% and reduces to roughly 5% after the rejection procedure. An uncertainty is evaluated by repeating the analysis without applying the electron rejection criteria, and scaling down the difference in the $\rho(r)$ distribution to the remaining electron contamination after applying the electron rejection, giving 0.3% and $< 0.1\%$. The efficiency in selecting photons has been extracted from simulation as a function of photon p_T and data are corrected for this efficiency. An uncertainty is assigned by comparing the results to the ones obtained with a correction derived by loosening the selection criteria, given 0.2% and $< 0.1\%$.

The uncertainties related to the jet energy resolution and jet energy scale are evaluated as in Ref. [37]. When propagated, the uncertainty related to the jet energy scale amounts to 6.9% and 0.8%, while the energy resolution gives uncertainties of 1.9% and 0.3%. The uncertainty related to the tracking inefficiency is estimated as the difference in the track reconstruction efficiency between data and simulation, as in Ref. [46]. Tracking corrections are varied in a p_T^{trk} -dependent way, giving systematic uncertainties of 1.0% and 0.9%.

Further systematic uncertainties are assigned for the r -dependent correction procedure. First, it is observed in MC simulations that the first step of corrections has a remaining disagreement of 2% at $r \approx 0.3$ between reconstructed tracks and true charged particles, in both the pp and Pb-Pb cases. Second, the model dependence of the corrections is studied by obtaining the quark and gluon jet shape distributions from MC simulations and fitting them to distributions in data. The extracted templates are varied

by the fit uncertainty. The difference between the nominal and varied templates is quoted as systematic uncertainty, amounting to 0.5 (1)% and 3 (4)% in the $r < 0.2$ ($r > 0.2$) case, for pp and Pb-Pb results, respectively.

For Pb-Pb collisions a systematic uncertainty for the background subtraction is estimated by combining two independent sources. First, results are obtained using an alternative background subtraction procedure (the so-called η -reflection method [20]) and compared to the nominal method. Second, nominal results are compared to the ones where the background distributions are not scaled for the UE particle density difference seen in simulation. The combined difference of 3.5% is assigned as the uncertainty.

The upper panel of Fig. 1 shows the differential jet shape $\rho(r)$ for both Pb-Pb and pp collisions, and PYTHIA simulation. The ratio of Pb-Pb to pp (simulated to pp) data distributions are shown in the lower panel. The simulation is slightly higher than the pp data at large r , but describes the pp data to within 10% in each bin, allowing its use to derive the r -dependent corrections. The uncertainties considered correlated between the pp and Pb-Pb datasets (from photon isolation, photon purity, photon efficiency, electron rejection, jet energy scale, jet energy resolution, tracking efficiency, and from the r -dependent procedure corrections) partially cancel in the ratio. The distribution in 50%–100% Pb-Pb collisions is consistent with that in pp collisions. The difference between the pp and the 0%–10% (0%–30%) Pb-Pb results was quantified by comparing the two distributions with a χ^2 test, including all statistical and systematical uncertainties. The p value found was 0.029 (0.017). This shows that, with a p -value cutoff of 0.05, the two sets of results are incompatible with each other for the two most central Pb-Pb collisions bins.

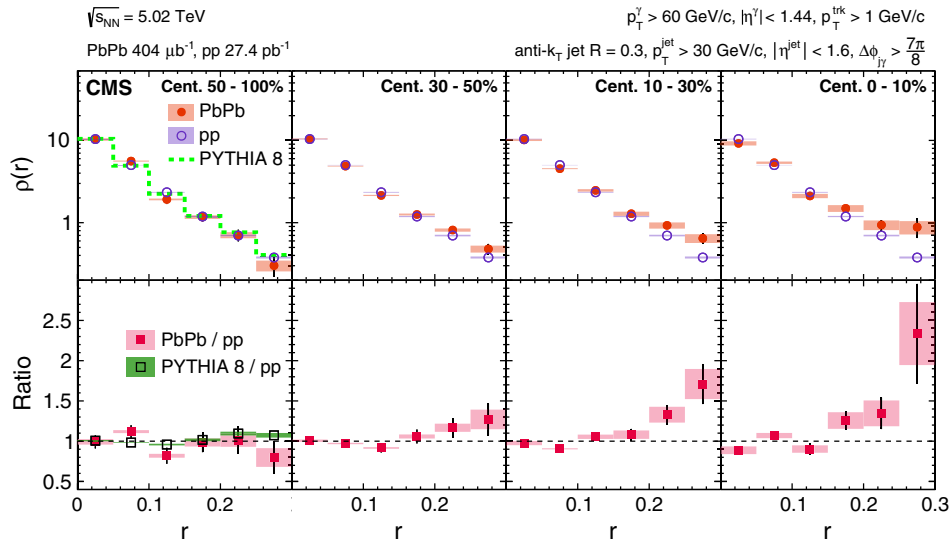

FIG. 1. Upper: The differential jet shape $\rho(r)$ for jets associated with an isolated photon for (from left to right) 50%–100%, 30%–50%, 10%–30%, 0%–10% Pb-Pb (solid circles), pp (open circles) collisions, and from PYTHIA simulation (histogram). Lower: The ratios of the Pb-Pb and pp distributions. For the pp results, the ratio is to the PYTHIA distribution. The vertical lines through the points represent statistical uncertainties, while the shaded colored boxes indicate the total systematic uncertainties in data.

In these central collisions, an enhancement of the $\rho(r)$ distribution with respect to the reference pp data is observed at $r \approx 0.3$. When integrated over different r intervals, the results show that $\sim 5\%$ of pp jet energy is beyond $r > 0.2$. For jets in 0%–10% Pb-Pb collisions the jet energy fraction changes to $\sim 9\%$. This implies that in Pb-Pb data a larger fraction of the jet momentum is carried at large distances from the jet axis. The enhancement seen at large r is in qualitative agreement with the inclusive jet shape results in Refs. [19,28], and both the leading and subleading jet shapes in Ref. [23]. In contrast, no significant depletion is seen in central collisions for intermediate r , as was observed in the aforementioned inclusive jet shape and leading jet shape results. This could be because of tagging the jet sample with isolated photons, which increases the quark jet fraction, and because of the lower p_T^{jet} threshold, which increases the fraction of less collimated jets (including those with a larger relative energy loss). On the other hand, the $\rho(r)$ distributions decrease rapidly with r , with the bulk of the jet energy being concentrated at small r in both collision systems. Since the fraction of $\rho(r)$ shifted from small to large r because of medium modifications in Pb-Pb collisions is small compared to the integrated fraction at small r , the depletion cannot appear large.

In summary, the differential jet shapes for jets associated with isolated photons are measured in pp and Pb-Pb collisions for the first time. They are constructed using charged particles with transverse momentum $p_T^{\text{trk}} > 1 \text{ GeV}/c$, for jets with $p_T^{\text{jet}} > 30 \text{ GeV}/c$, which are associated with an isolated photon with $p_T^\gamma > 60 \text{ GeV}/c$. While the distribution from the most peripheral (50%–100%) Pb-Pb collisions is consistent with that in pp data, a modification of the jet shape in Pb-Pb collisions is observed in more central events. The 0%–10% (0%–30%) Pb-Pb $\rho(r)$ is enhanced for the distance between the track and the jet axis $r \gtrsim 0.15$ (0.20). No significant suppression is seen at intermediate r . The modifications demonstrate that for hard scatterings that predominantly produce quarks with similar momentum distributions in pp and Pb-Pb collisions, as identified by the photon tag, the jet momentum is distributed at greater radial distance in Pb-Pb collisions. This significant redistribution of energy observed in central Pb-Pb collisions, compared with pp and peripheral Pb-Pb collisions, can be interpreted as a direct observation of jet broadening in the quark-gluon plasma (QGP). This first measurement of radial momentum density profile for jets tagged by an isolated photon, which constrains the information about the jet energy before any loss occurred while traversing the QGP, constitutes a new unambiguous reference for testing theoretical models of parton-medium interactions.

We congratulate our colleagues in the CERN accelerator departments for the excellent performance of the LHC and

thank the technical and administrative staffs at CERN and at other CMS institutes for their contributions to the success of the CMS effort. In addition, we gratefully acknowledge the computing centers and personnel of the Worldwide LHC Computing Grid for delivering so effectively the computing infrastructure essential to our analyses. Finally, we acknowledge the enduring support for the construction and operation of the LHC and the CMS detector provided by the following funding agencies: BMBWF and FWF (Austria); FNRS and FWO (Belgium); CNPq, CAPES, FAPERJ, FAPERGS, and FAPESP (Brazil); MES (Bulgaria); CERN; CAS, MoST, and NSFC (China); COLCIENCIAS (Colombia); MSES and CSF (Croatia); RPF (Cyprus); SENESCYT (Ecuador); MoER, ERC IUT, and ERDF (Estonia); Academy of Finland, MEC, and HIP (Finland); CEA and CNRS/IN2P3 (France); BMBF, DFG, and HGF (Germany); GSRT (Greece); NKFI (Hungary); DAE and DST (India); IPM (Iran); SFI (Ireland); INFN (Italy); MSIP and NRF (Republic of Korea); MES (Latvia); LAS (Lithuania); MOE and UM (Malaysia); BUAP, CINVESTAV, CONACYT, LNS, SEP, and UASLP-FAI (Mexico); MOS (Montenegro); MBIE (New Zealand); PAEC (Pakistan); MSHE and NSC (Poland); FCT (Portugal); JINR (Dubna); MON, RosAtom, RAS, RFBR, and NRC KI (Russia); MESTD (Serbia); SEIDI, CPAN, PCTI, and FEDER (Spain); MOSTR (Sri Lanka); Swiss Funding Agencies (Switzerland); MST (Taipei); ThEPCenter, IPST, STAR, and NSTDA (Thailand); TUBITAK and TAEK (Turkey); NASU and SFFR (Ukraine); STFC (United Kingdom); DOE and NSF (USA).

¹¹⁹*ETH Zurich—Institute for Particle Physics and Astrophysics (IPA), Zurich, Switzerland*
¹²⁰*Universität Zürich, Zurich, Switzerland*
¹²¹*National Central University, Chung-Li, Taiwan*
¹²²*National Taiwan University (NTU), Taipei, Taiwan*

- ¹²³*Chulalongkorn University, Faculty of Science, Department of Physics, Bangkok, Thailand*
¹²⁴*Çukurova University, Physics Department, Science and Art Faculty, Adana, Turkey*
¹²⁵*Middle East Technical University, Physics Department, Ankara, Turkey*
¹²⁶*Bogazici University, Istanbul, Turkey*
¹²⁷*Istanbul Technical University, Istanbul, Turkey*
¹²⁸*Institute for Scintillation Materials of National Academy of Science of Ukraine, Kharkov, Ukraine*
¹²⁹*National Scientific Center, Kharkov Institute of Physics and Technology, Kharkov, Ukraine*
¹³⁰*University of Bristol, Bristol, United Kingdom*
¹³¹*Rutherford Appleton Laboratory, Didcot, United Kingdom*
¹³²*Imperial College, London, United Kingdom*
¹³³*Brunel University, Uxbridge, United Kingdom*
¹³⁴*Baylor University, Waco, Texas, USA*
¹³⁵*Catholic University of America, Washington, DC, USA*
¹³⁶*The University of Alabama, Tuscaloosa, Alabama, USA*
¹³⁷*Boston University, Boston, Massachusetts, USA*
¹³⁸*Brown University, Providence, Rhode Island, USA*
¹³⁹*University of California, Davis, Davis, California, USA*
¹⁴⁰*University of California, Los Angeles, California, USA*
¹⁴¹*University of California, Riverside, Riverside, California, USA*
¹⁴²*University of California, San Diego, La Jolla, California, USA*
¹⁴³*University of California, Santa Barbara—Department of Physics, Santa Barbara, California, USA*
¹⁴⁴*California Institute of Technology, Pasadena, California, USA*
¹⁴⁵*Carnegie Mellon University, Pittsburgh, Pennsylvania, USA*
¹⁴⁶*University of Colorado Boulder, Boulder, Colorado, USA*
¹⁴⁷*Cornell University, Ithaca, New York, USA*
¹⁴⁸*Fermi National Accelerator Laboratory, Batavia, Illinois, USA*
¹⁴⁹*University of Florida, Gainesville, Florida, USA*
¹⁵⁰*Florida International University, Miami, Florida, USA*
¹⁵¹*Florida State University, Tallahassee, Florida, USA*
¹⁵²*Florida Institute of Technology, Melbourne, Florida, USA*
¹⁵³*University of Illinois at Chicago (UIC), Chicago, Illinois, USA*
¹⁵⁴*The University of Iowa, Iowa City, Iowa, USA*
¹⁵⁵*Johns Hopkins University, Baltimore, Maryland, USA*
¹⁵⁶*The University of Kansas, Lawrence, Kansas, USA*
¹⁵⁷*Kansas State University, Manhattan, Kansas, USA*
¹⁵⁸*Lawrence Livermore National Laboratory, Livermore, California, USA*
¹⁵⁹*University of Maryland, College Park, Maryland, USA*
¹⁶⁰*Massachusetts Institute of Technology, Cambridge, Massachusetts, USA*
¹⁶¹*University of Minnesota, Minneapolis, Minnesota, USA*
¹⁶²*University of Mississippi, Oxford, Mississippi, USA*
¹⁶³*University of Nebraska-Lincoln, Lincoln, Nebraska, USA*
¹⁶⁴*State University of New York at Buffalo, Buffalo, New York, USA*
¹⁶⁵*Northeastern University, Boston, Massachusetts, USA*
¹⁶⁶*Northwestern University, Evanston, Illinois, USA*
¹⁶⁷*University of Notre Dame, Notre Dame, Indiana, USA*
¹⁶⁸*The Ohio State University, Columbus, Ohio, USA*
¹⁶⁹*Princeton University, Princeton, New Jersey, USA*
¹⁷⁰*University of Puerto Rico, Mayaguez, Puerto Rico*
¹⁷¹*Purdue University, West Lafayette, Indiana, USA*
¹⁷²*Purdue University Northwest, Hammond, Indiana, USA*
¹⁷³*Rice University, Houston, Texas, USA*
¹⁷⁴*University of Rochester, Rochester, New York, USA*
¹⁷⁵*Rutgers, The State University of New Jersey, Piscataway, New Jersey, USA*
¹⁷⁶*University of Tennessee, Knoxville, Tennessee, USA*
¹⁷⁷*Texas A&M University, College Station, Texas, USA*
¹⁷⁸*Texas Tech University, Lubbock, Texas, USA*
¹⁷⁹*Vanderbilt University, Nashville, Tennessee, USA*
¹⁸⁰*University of Virginia, Charlottesville, Virginia, USA*
¹⁸¹*Wayne State University, Detroit, Michigan, USA*
¹⁸²*University of Wisconsin—Madison, Madison, Wisconsin, USA*

- ^aDeceased.
- ^bAlso at Vienna University of Technology, Vienna, Austria.
- ^cAlso at IRFU, CEA, Université Paris-Saclay, Gif-sur-Yvette, France.
- ^dAlso at Universidade Estadual de Campinas, Campinas, Brazil.
- ^eAlso at Federal University of Rio Grande do Sul, Porto Alegre, Brazil.
- ^fAlso at Université Libre de Bruxelles, Bruxelles, Belgium.
- ^gAlso at University of Chinese Academy of Sciences, Beijing, China.
- ^hAlso at Institute for Theoretical and Experimental Physics, Moscow, Russia.
- ⁱAlso at Joint Institute for Nuclear Research, Dubna, Russia.
- ^jAlso at British University in Egypt, Cairo, Egypt.
- ^kAlso at Suez University, Suez, Egypt.
- ^lAlso at Zewail City of Science and Technology, Zewail, Egypt.
- ^mAlso at Department of Physics, King Abdulaziz University, Jeddah, Saudi Arabia.
- ⁿAlso at Université de Haute Alsace, Mulhouse, France.
- ^oAlso at Skobeltsyn Institute of Nuclear Physics, Lomonosov Moscow State University, Moscow, Russia.
- ^pAlso at Tbilisi State University, Tbilisi, Georgia.
- ^qAlso at CERN, European Organization for Nuclear Research, Geneva, Switzerland.
- ^rAlso at RWTH Aachen University, III. Physikalisches Institut A, Aachen, Germany.
- ^sAlso at University of Hamburg, Hamburg, Germany.
- ^tAlso at Brandenburg University of Technology, Cottbus, Germany.
- ^uAlso at MTA-ELTE Lendület CMS Particle and Nuclear Physics Group, Eötvös Loránd University, Budapest, Hungary.
- ^vAlso at Institute of Nuclear Research ATOMKI, Debrecen, Hungary.
- ^wAlso at Institute of Physics, University of Debrecen, Debrecen, Hungary.
- ^xAlso at IIT Bhubaneswar, Bhubaneswar, India.
- ^yAlso at Institute of Physics, Bhubaneswar, India.
- ^zAlso at Shoolini University, Solan, India.
- ^{aa}Also at University of Visva-Bharati, Santiniketan, India.
- ^{bb}Also at Isfahan University of Technology, Isfahan, Iran.
- ^{cc}Also at Plasma Physics Research Center, Science and Research Branch, Islamic Azad University, Tehran, Iran.
- ^{dd}Also at Università degli Studi di Siena, Siena, Italy.
- ^{ee}Also at Kyunghee University, Seoul, Korea.
- ^{ff}Also at International Islamic University of Malaysia, Kuala Lumpur, Malaysia.
- ^{gg}Also at Malaysian Nuclear Agency, MOSTI, Kajang, Malaysia.
- ^{hh}Also at Consejo Nacional de Ciencia y Tecnología, Mexico city, Mexico.
- ⁱⁱAlso at Warsaw University of Technology, Institute of Electronic Systems, Warsaw, Poland.
- ^{jj}Also at Institute for Nuclear Research, Moscow, Russia.
- ^{kk}Also at National Research Nuclear University 'Moscow Engineering Physics Institute' (MEPhI), Moscow, Russia.
- ^{ll}Also at St. Petersburg State Polytechnical University, St. Petersburg, Russia.
- ^{mm}Also at University of Florida, Gainesville, Florida, USA.
- ⁿⁿAlso at P.N. Lebedev Physical Institute, Moscow, Russia.
- ^{oo}Also at INFN Sezione di Padova, Università di Padova, Padova, Italy, Università di Trento, Trento, Italy.
- ^{pp}Also at Budker Institute of Nuclear Physics, Novosibirsk, Russia.
- ^{qq}Also at Faculty of Physics, University of Belgrade, Belgrade, Serbia.
- ^{rr}Also at INFN Sezione di Pavia, Università di Pavia, Pavia, Italy.
- ^{ss}Also at University of Belgrade, Faculty of Physics and Vinca Institute of Nuclear Sciences, Belgrade, Serbia.
- ^{tt}Also at Scuola Normale e Sezione dell'INFN, Pisa, Italy.
- ^{uu}Also at National and Kapodistrian University of Athens, Athens, Greece.
- ^{vv}Also at Riga Technical University, Riga, Latvia.
- ^{ww}Also at Universität Zürich, Zurich, Switzerland.
- ^{xx}Also at Stefan Meyer Institute for Subatomic Physics, Vienna, Austria.
- ^{yy}Also at Gaziosmanpasa University, Tokat, Turkey.
- ^{zz}Also at Adiyaman University, Adiyaman, Turkey.
- ^{aaa}Also at Istanbul Aydin University, Istanbul, Turkey.
- ^{bbb}Also at Mersin University, Mersin, Turkey.
- ^{ccc}Also at Piri Reis University, Istanbul, Turkey.
- ^{ddd}Also at Ozyegin University, Istanbul, Turkey.
- ^{eee}Also at Izmir Institute of Technology, Izmir, Turkey.
- ^{fff}Also at Marmara University, Istanbul, Turkey.
- ^{ggg}Also at Kafkas University, Kars, Turkey.

- ^{hhh} Also at Istanbul University, Faculty of Science, Istanbul, Turkey.
- ⁱⁱⁱ Also at Istanbul Bilgi University, Istanbul, Turkey.
- ^{jjj} Also at Hacettepe University, Ankara, Turkey.
- ^{kkk} Also at Rutherford Appleton Laboratory, Didcot, United Kingdom.
- ^{lll} Also at School of Physics and Astronomy, University of Southampton, Southampton, United Kingdom.
- ^{mmm} Also at Monash University, Faculty of Science, Clayton, Australia.
- ⁿⁿⁿ Also at Bethel University, St. Paul, Minnesota, USA.
- ^{ooo} Also at Karamanoğlu Mehmetbey University, Karaman, Turkey.
- ^{ppp} Also at Utah Valley University, Orem, Utah, USA.
- ^{qqq} Also at Purdue University, West Lafayette, Indiana, USA.
- ^{rrr} Also at Beykent University, Istanbul, Turkey.
- ^{sss} Also at Bingol University, Bingol, Turkey.
- ^{ttt} Also at Sinop University, Sinop, Turkey.
- ^{uuu} Also at Mimar Sinan University, Istanbul, Istanbul, Turkey.
- ^{vvv} Also at Texas A&M University at Qatar, Doha, Qatar.
- ^{www} Also at Kyungpook National University, Daegu, Korea.
